

In a scalable architecture, inverters and power optimizers integrate as needed, smart modules, electric vehicle charging solutions, smart home devices and back-up options. At the heart of it all, the new SolarEdge Energy Operating System intelligently manages ...

Power Optimizers. Power optimizers work as an option to pair with a string inverter. This type of inverters is considered a compromise between string inverters and microinverters. Just in the case of microinverters, power optimizers are placed on the roof next to individual solar panels.

SolarEdge Power Optimizers are DC/DC converters connected by installers to each solar module, effectively turning them into smart modules. They were developed by SolarEdge's founders in order to solve the problem of module mismatch in PV systems.

Supporting commercial and industrial rooftops, ground mounts and carports, the S1400 Power Optimizer delivers 99.5% efficiency and the ability to track sunlight at multiple angles through Maximum Power Point Tracking (MPPT) for higher system production.

Power optimizers use maximum power point tracking to make the DC power output from panels optimal. This optimal DC power is fed to the Solar Inverters to get the efficient flow of current at optimal levels.
